#### IC component

IC component

IC (Integrated Circuit) is a large number of microelectronic components (transistors, resistors, capacitors, etc.) formed by the Integrated Circuit on a plastic substrate, into a chip. Today almost all the chips you see can be called IC chips. An integrated circuit is a miniature electronic device or component. Using a certain process, the necessary transistors, diodes, resistors, capacitors, inductors and other components and wiring in a circuit are interlinked together and made on a small piece or several small semiconductor chips or dielectric substrates, it is then encapsulated in a shell and tube to form a miniature structure with the required circuit functions, in which all the components are structurally integrated, this is a big step towards electronic component miniaturization, low power consumption and high reliability.
